

This battlecard assumes the customer or prospect understands the business value of Windchill and therefore focuses on the value enablement and additional benefits that Windchill+ provides. For a broader discussion of PLM value refer to these battlecards as a baseline:

- [PLM Foundation: Advancing the Digital Thread](#)
- [Navigate to the Fast Track Sales Play Battlecard V2](#)
- [PLM for Digitalization Battlecard](#)

Market Segment Introduction

"For more than two decades, many of the world's most sophisticated manufacturing companies have used Windchill to design, develop, and manufacture their products," said Jim Heppelmann, past President and CEO of PTC. "Windchill+ unleashes an exciting new future for our Windchill product line, delivering the full digital transformation power of PLM while simplifying deployment, usage, and upgrades through the use of a modern SaaS architecture."

Three Scenarios:

- **Windchill On-Premises customer:** Windchill+ relieves IT burden and accelerates PLM adoption and time-to-value. Positioning Deck [here](#).
- **Windchill Cloud with Managed Services customer:** Windchill+ accelerates PLM adoption and time-to-value. This scenario can be PTC Cloud customer, 3rd party hosting service, or a DIY Cloud Customer (ex. customer running Windchill on AWS by themselves). Positioning Deck [here](#).
- **New to Windchill prospect:** Windchill+ offers the best-in-class benefits of Windchill, relieves IT burden, and accelerates PLM adoption and time-to-value. Positioning Deck [here](#).

Value Drivers

Enabling our customer top strategic initiatives is the guiding light for successful Windchill+ campaigns. Windchill+ best enables customer to realize more value faster, with the added benefit of less risk and an industry best practice SaaS experience.

Risk

- **Security** – Best-in-class cybersecurity reduces risk that a company's Intellectual Property will be compromised.

Time:

- **Speed to adoption** – Rapidly expand PLM beyond core engineering. All deployments are based off a single best practice configuration to enable customers to adopt new capabilities seamlessly

- **Speed to collaboration** – You'll be easily able to expand geographically beyond borders to new user groups and or distributed partners. You will no longer have to set up complex data replication or run data migration jobs. Accessibility no longer hinders the customer's ability to realize the full potential of PLM.
- **Speed to configure** – WC+ comes pre-configured and is ready day 1. System configuration is often the largest challenge in achieving the full value of PLM.
- **Speed to application issue resolution** – Pro-active resolution of risk before they become a big issue.

Cost:

- No surprises on required infrastructure costs.
- Offset costs due to the shift of responsibility - No cost to install/configure/maintain.

Quality:

- Improved global collaboration and automation that drives down the costs of poor quality.
- Better stability and performance in application.
- Compatibility across PTC's portfolio.

Revenue:

- Faster time to market via improved Collaboration, Speed, Reuse and Agility

Use Cases

100% as it was with Windchill on-premises

When customers come onto Windchill +, they get 100% compatibility with all the OOTB functionality they have on-premises. Additionally, Windchill+ will still allow customization / tailoring, in much the same way as on-premises, if they meet the fundamental principles of security, scalability, and upgradability. It is the same code base – Windchill+ product emphasis in the near term will focus on providing better PLM Collaboration, a modern SaaS like approach to system Administration, improved Visibility and Metrics – all while operating securely in a high availability environment. We understand that each business may have unique processes that offers them a competitive advantage. We allow customization and tailoring of our OOTB workflows within guardrails that ensure seamless upgrades and support.

PLM ROI Acceleration:

- The business case for PLM is predicated on getting more PLM capabilities deployed to more users across the enterprise. Windchill + eliminates the

Windchill+ Battlecard

technical debt that has constrained companies in the past. The ROI benefit of bringing enterprise-wide business benefits to the company's bottom line can be significant.

- Accelerate PLM value today! With Windchill +, a pre-configured secure PLM service, new capabilities and updates are seamlessly and automatically added to customers PLM environment. It just works! Shorter PLM payback periods equals money. Cash flow grows as users adopt new capabilities in weeks vs. months and years.
- Instantly provide as-needed access to PLM users and enable more functionality as your business needs change.

Target Companies

- We will work with new and existing customers wherever they are on the journey to the cloud – very flexible in timing. No one will be forced to move to SaaS.
- Customers can start their standardization journey in preparation for SaaS (e.g., when they are planning an upgrade while on-premises, taking CPS's more frequently, documenting their validation use-cases, etc.) working with PTC field services, GSIs, RSI, etc.
- It is critical that we educate all potential Windchill+ customers to identify if they are "move now" and, if not, so they can start planning their technical and commercial fit, so they are sold on the value proposition, and so they can move to Windchill+ when our technology and business is ready for them. See this [asset](#) for guidance.

Target Buyer Personas

PLM Application Owner (AKA Champion)

PLM application owners or administrators are tasked with keeping their systems and processes up-to-date and configured to meet the needs of business users primarily in engineering, but increasingly throughout the enterprise. Their biggest challenge to delivering the benefits of PLM is system configuration. With Windchill+ they have more bandwidth to focus on value-added activities that drive efficiency and adoption, significantly increasing the value their company realizes with PLM.

- Reduce risk of PLM system being hacked & company Intellectual Property being exposed.
- Continuously realize more business value via an industry best practice SaaS experience.

- Eliminate the time-consuming burden of software maintenance and updating.
- Rapidly on-board new users and support remote work with instant global user access.
- De-customize difficult to maintain customizations.

IT Strategy Leader

IT leaders are driving security-by-design, standardization, and democratization of data through real-time collaboration. A common goal among IT leaders is to eliminate legacy IT costs and replace technical debt with either off the shelf capabilities or customizations that won't impact security, productivity, or upgradeability. With Windchill+ they:

- Reduce risk of PLM system being hacked & company Intellectual Property being exposed.
- Better ensure compliance with IT & industry certifications.
- Reduce risk of system performance and availability issues.
- Reduce IT support costs - Decreasing resources to upgrade, reducing resources to administrate, reducing time to troubleshoot, and reducing upgrade costs.
- Reduce cost and risk of maintaining customizations and other technical debt.

Business Leader – Engineering/R&D

Engineering leaders are tasked with improving product differentiation and quality. To achieve this, they are under pressure to move their teams faster with greater collaboration. With Windchill+ they gain all the best-in-class capabilities of Windchill, plus they:

- Significantly increase the value realized with PLM by accelerating enterprise adoption and maturity of PLM tools and processes – Extending them beyond traditional roles in the engineering organization
- Accelerate PLM adoption through standardizing processes & leveraging a modernized SaaS architecture.
- Eliminate previous IT support and environment constraints and take advantage of new PLM capabilities more quickly.

Finance Leader

A finance executive will likely need to sign off as the additional cost of Windchill+ over traditional on-premises PLM solutions may not be budgeted. There are two things they must recognize:

- The higher sticker-price may be materially offset by the reduction and elimination of many IT and administrative costs.
- More importantly, the cost of windchill+ can and should be justified by the increased value it brings to engineering and other organizations across the enterprise.
- Reduce risk of company Intellectual Property hacked & compliance issues.

Command of the Message

Before Scenarios

- Upgrades are painful: difficult, slow & infrequent. Customer customizations often lock companies into the past and prevents deploying new features.
- Companies configure, customize, and deploy systems utilizing existing processes developed for legacy tools or even paper. This technical debt locks the company into past practices and limits the ability to adapt to new challenges, new markets, and market disruption. Adoption can be low/slow because systems are often difficult to use & upgrade.
- Companies struggle to deploy PLM across the enterprise unlocking a fraction of the potential value they could get from PLM. The customers frequently lack the resources and knowledge to take on this responsibility. As such, they get stuck in first gear of the value of PLM, deploying only to engineering.
- Companies know they need to change their processes to unlock the value of enterprise PLM but are not provided much/any guidance on how to do so. Traditional PLM tools do not provide recommended processes and configurations out of the box leaving customers to develop their own solution.
- Significant Cybersecurity & IP Protection Risks – Supplier collaboration requires letting suppliers thru corporate firewalls to access on premises PLM solutions. Providing this entry to hundreds/thousands of companies puts the entire organization's network at risk.
- Significant Cybersecurity Risks – A single security vulnerability, like Log4j, may impact dozens or hundreds of applications. On premise or DIY Cloud customers are only safe after they patch their own

Windchill+ Battlecard

solutions and may need to prioritize which solutions to work on leaving the rest vulnerable.

- Lack real-time visibility & collaboration across extended enterprise - Lack full digital traceability across internal product development processes and with external partners. Leads to errors, late-stage changes, and delays.
- Legacy processes and technical debt result in non-standard configurations that restrict the deployment of additional capabilities and new functionality. This restricts customers from gaining additional value from their investment.

Negative Consequences

Customer's largest challenge in achieving the full value of PLM is system configuration. An on-prem solution is always playing catch-up, behind the game and at great cost. They live in a land of uncertainty - Not knowing how/when to do upgrades, planning mitigations for customizations, allocating capacity for basic administration, and overall user experience.

- **Risk**
 - Increased risk that company's Intellectual Property will be compromised.
 - Increased risk that enterprise systems will be hacked.
 - Reduced employee satisfaction due to old systems with poor user experiences.
- **Time**
 - Inefficient tools and processes created non-value-added work.
 - Late-stage changes delay product launches & increase cost of poor quality.
 - Serial processes increase product schedules.
 - Downtime due to lengthy upgrades and/or system issues
- **Cost**
 - Late-stage issues are much more expensive to implement given the physical material impact.
 - Lack of reuse increases product and inventory costs
 - Inefficient processes increase product development costs.
 - Quality issues increase warranty and service costs.
 - Increased cost of employee training and retention. People entering the workforce don't want to be working on 10-year-old systems, cumbersome (customized) processes, and/or in chaotic paper-based environments.
 - Expensive upgrades

Quality

- o Ineffective collaboration increases quality issues.
- o Results in quality issues being identified when the physical product is being manufactured, which leads to scrap and rework.
- o Lack of closed-loop feedback reduces opportunity for product improvement.

Revenue

- o Forces serialized product development across Engineering, Suppliers, Quality, Manufacturing & Service (Waterfall).
- o Late to market erodes revenue and price premium advantage.
- o Reduce customer satisfaction by not hitting customer deadlines.
- o Slow to adapt products to accommodate market changes - Lack of an efficient enterprise PLM system, outside of Engineering, slows the ability to change products.

IT Support

- o Legacy PLM is highly customized, difficult to support & slow to update.

After Scenarios

Leverage an industry best practice SaaS application experience for PLM with Windchill+. Look to accelerate enterprise product development maturity, increase user, increase and reduce IT costs/risk.

- Pre-configured PLM Best-Practices - Pre-configured product development best-practices are instantly available in the cloud. Eliminate up to 60% of on premises/DIY Cloud work.
- Standardization & modernization accelerates velocity by driving process change and discarding technical debt. On-premises PLM systems often have customizations driven by legacy processes that are inefficient and make upgrades very difficult. Best-in-class process can be utilized with Windchill + with Out-of-the-box capabilities.
- Synchronous collaboration across extended enterprise – Enable distributed users to work, live and in-context, on digital product definitions
- Frictionless expansion of PLM capabilities and group adoption - Rapidly make PLM available to additional product development functions. Rapidly turn on advanced PLM capabilities within integral cloud environment.
- Always be on the latest release and leveraging the latest functionality at no additional upgrade cost. Maximize your PLM investment by always having access to the latest capabilities.

Positive Business Outcomes

Windchill + significantly increases the value a company realizes with PLM by accelerating enterprise adoption, increasing product development maturity and removing the barriers that inhibit new feature/functionality utilization.

Reduced Time to Market – More rapidly leverage PLM best-practices to get to the best product design faster. Automate the creation and update of content across the enterprise.

Increased Product Development Capacity – Increased automation, earlier cross-functional collaboration, controlled external collaboration, & automated communication.

Increased Quality – Increased digital thread information traceability, increased cross-functional collaboration, increased enterprise reuse and earlier design automation.

Reduced Cost - Better rationalize parts & enable strategic sourcing decisions earlier in product lifecycle. Proactively identify duplicates & near duplicates.

Reduced IT Support Costs & Risks – Decrease resources to upgrade, reduce resources to administrate, reduce time to troubleshoot, increase system performance and increase availability.

Reduced payback period - Rapid enterprise adoption drives faster time to value which drives reduced payback period. That frees up money for new company investments.

Required Capabilities

- **SaaS Application Experience** – Truly native SaaS experience with streamlined provision and frictionless expansion
- **Comprehensive PLM Functionality** – Broadest set of PLM capabilities within SaaS application. Manage workflow-driven activities that link every phase of a product lifecycle with end-to-end traceability (See Windchill battlecards).
- **Ease of Administration** – The SaaS solution/service must offer automated tools, streamlined self-

Windchill+ Battlecard

service capabilities, and the solution/service provider must be responsible for non-value-added administrative tasks.

- **Streamlined Processes** – Extensible, out-of-the-box processes based on industry standards and best practices are necessary for companies to rid themselves of technical debt.
- **Minimal Effort Capability Adoption** – Once established new, innovative PLM capabilities must be easy to adopt and integrate into solution architecture.
- **Global Collaboration** – The offering must allow participants from around the world to be quickly and easily added as participants, with no concern over security or performance.
- **Built-in Security** – Protecting IT infrastructure and IP assets in the cloud requires full-stack security.
- **Open Architecture** – Secure interoperability across heterogeneous systems and applications with standards-based integration & data flow (OSLC, REST, STEP, etc.) to reduce the risk of unexpected third-party costs and challenges.
- **Full Stack Service** – Frictionless provisioning and on-boarding, SSO support, on-demand transparent back-up and restore, decreased bug resolution time.
- **Performance, Scale & Stability** – Deployment architecture ensures performance, scale, and stability

Metrics

- **Financial Metrics**
 - o Increased Revenue
 - o Decreased Product Costs
 - o Decreased Labor Costs
 - o Decreased Cost of Quality (Warranty, Scrap, Rework, etc.)
 - o Reduced IT Total Cost of Ownership Costs (TCO)
- **Operational Metrics**
 - o Increase Productivity
 - o Reduce Cycle Time (NPI, Change)
 - o Increase Part Reuse
 - o Reduce Late-Stage Changes
 - o Collaboration - Growth in the # Users outside of core engineering (across the

enterprise, partners, customers, regulators)

- o Time to deploy new users / groups
- o Time to Value – reduction in time to achieve ROI for given PLM capability
- o Time to deploy new capabilities and features
- o Time to upgrade

- **Technical Metrics**

- o Number of Users
- o Software Module Utilization
- o Capabilities Deployed
- o System Availability
- o System Upgrades
- o System Support Resources
- o Application Operations
 - Time
 - Resources
- o Application Support
 - Time to provision and onboard new users
 - Bug resolution (count, time)
 - Product stability (availability)
 - Tech Stack optimization for performance (resources, time)
- o License Management
 - Time,
 - Resources
 - Costs
- o Maintenance (Time)
- o Solution Management
 - IT changes such as re-platforming OS/hardware
 - Process changes due to onboarding new capabilities or business units
 - Add-on customizations or de-customization requiring data manipulation

The Solution - How We Do It

Elevator Pitch

Windchill + delivers a best practice PLM SaaS experience that accelerates time to value with the frictionless adoption of PLM across the extended enterprise. Look to realize more value with PLM faster, with best-in-class performance and security. Most companies take years to expand PLM outside of core engineering realizing only a fraction of the available value. Stop doing things the way you did 20 years ago. Windchill+ is the first enterprise PLM SaaS application that helps you master complexity with highly

tailorable/customizable OOTB workflows that allow you to work the way you desire too.

How We Do It Better

Performance, Scale & Stability – Exclusive deployment architecture ensures performance, scale, and stability.

- **User experience** - No load disruption – automatic routing to nodes that have high resource capability. No required user acceptance testing.
- ***Auto-scaling** - PTC-proprietary algorithms optimize performance & scalability based on long-term usage trends. *Available ~August 2023
- **PTC has developed dozens of monitoring points across the solution stack to detect hot spots.**
- **PTC has integrated teams that work across support, operations, and R&D to fix issues fast.**
- **Exclusive deployment architecture for WC+ allows for databases to scalable meet demand.**
- **VCS is the first example of an SaaS based, cloud native, highly elastic/high performance service that scales up and down dynamically to meet demand.**
- **Accelerated response refreshing lower tier environments (rehosting) and disaster recovery activities.**

IT Risk & Support Costs Eliminated/Reduced– Significantly reduce work required to administrator enterprise PLM systems

- **Security** - No need to apply patches (i.e., Log4J).
- **Deployment** - PTC is responsible for managing a deployment and responsible for the full stack.
- **Vaulting** - No need to copy vaults for a clone or wait for a copy task or to copy content. Shared vaults between production and non-production system allows for faster rehosting turnaround time.
- **Cloning /re-host** - No special hardware, no worries about refreshing data from production to test.
- **Package/deploy/test a change** - Self-service with a standard way to build/provide packages.
- **On-demand** - Transparent back-up and restore. Instant application changes with zero downtime (minutes vs. days).
- **Decreased product bug resolution time** - Pro-actively resolve defects before they become a big issue. Visibility into customer specific scenarios.
- **Observability** – Data visualization for transparency and insight to enhance resource allocation and optimize cost. Improve license usage

Windchill+ Battlecard

transparency and reduce software expenditures. Enhance adoption trends and enable strategic alignment. Informs resource allocation and training/skillset needs.

Vertical & Horizontal Compatibility – The PLM system just works

- **Eliminates any question of vertical compatibility: Infrastructure is assured up and down the stack– versions of OS, Java, Database, etc. are guaranteed compatible**
- **Better control of application compatibility. Prescriptive upgrade schedule accounts for compatibility across all PTC SaaS offerings.**
- **Managed evolution of interoperability so the customer doesn't have to (OSLC, REST, etc.).**

Best In Class Cybersecurity – Highly tuned, always up to date, vulnerability detection/ incident response.

- **PTC absorbs the cost of full stack security. (application and infrastructure) by spreading it out across all environments – economies of scale.**
- **System always on the latest version to prevent any security gaps.**
- **A single point of responsibility as your service & cloud provider for any security incident.**
- **Highly tuned vulnerability detection.**
- **Tight security protocols and certified data centers.**
- **Systems are audited by third party security professionals.**

Exclusive publishing service (VCS)

- **Scalability to react to demands from migrations or large data imports.**
- **More consistent business administration by removing the need to configure workers.**
- **Advanced analytics to react & recover from adverse events without the need for republishing.**

Open Modern Interfaces – Exclusive integration capabilities eliminate the need for VPNs/point to point integrations

- **Focused pattern of integration through Windchill REST Services (WRS).**

Faster implementations

- **On-demand access to functionality: Every module is available on-demand and can be exposed in the environment on-demand.**

- **Highly optimized/based on years of experience.**
- **Zero effort and time required to architect the core systems, allows IT to focus on key integrations, and start on business-specific configuration and customization immediately.**
- **Non-production environments are kept up to date and accelerates implementation time frames.**

Competition

For more detailed competitive information, please check the PTC Competitive Positioning page in Velocity [here](#).

Siemens Teamcenter X

Strategy:

- Positions PLM Cloud as flexible, enterprise-ready Infrastructure as a Service (IaaS) offering. Customers purchase software and infrastructure separately.
- Third party (Atos) is hosting provider
- PDM on the Cloud for NX and Solid Edge is supported with Teamcenter Rapid Start (an SMB-focused PDM solution)

Target Market/Persona:

- SMB to Enterprise companies; VP IT, CIO, VP Engineering, CTO

Pricing:

- Teamcenter SW is purchased separately

Differentiators/Messaging:

- Key Message: Teamcenter – Realize Innovation.
- Infrastructure as OpEx vs. CapEx, lower cost PLM ownership
- Simplified, instant, and flexible deployment, scale up/down
- IaaS delivery option gives you cost-effective access to enterprise-grade IT infrastructure
- Secure deployment with AWS

Weaknesses:

- Poorly integrated acquisitions (product & organizational). Ex: Mendix is a separate architecture
- Late recognition of Digital Thread importance
- Teamcenter based on old & aging architectures

Dassault 3D Experience Cloud Platform

Strategy:

- Enovia V6-based solution on prem, public or private cloud

- Position 3D experience cloud platform as a complete, integrated platform for designing products as a system
- Runs own cloud through acquisition of Outscale
- Lead with CAD, specifically CATIA V5 and SOLIDWORKS Desktop migrations to 3DS, for which only ENOVIA 3DS supports PDM

Target Market/Persona:

- Mainly CATIA V5 install base. Top verticals are A&D and automotive.

Pricing:

- Customers need to buy everything to get to PLM
- **Role-based, not product-based, subscriptions force inclusion of 3DS products that the customer may not want.**

Differentiators/Messaging:

- 3DEXPERIENCE platform is a BUSINESS EXPERIENCE platform
- SW solutions - from marketing to sales to engineering – that in your value creation process, create differentiating consumer experiences
- Deliver full capabilities of 3D Modeling, Content & Simulation, Social & Collaborative innovation and Information Intelligence.
- Leads the market trend toward industry-focused, role-based packaged solutions aimed to help companies achieve rapid time to value for PLM

Weaknesses:

- Lack of flexibility - 3DS locks in users to Dassault's ecosystem and integrates poorly with others. Does not co-exist with older IT ecosystems. Few, if any, enterprise customers can use the SaaS version and instead must (very expensively!) privately host 3DS either with Dassault or on their own
- Disjointed portfolio – 3DS looks good on the surface, yet lacks cohesion
- Dassault messages to the market that IoT does not matter for PLM. However, customers disagree

Aras Enterprise SaaS

Strategy:

- Offer an open, flexible, scalable, upgradable, and adaptable low code PLM platform
- Land and expand with free offering. Wrap then replace with connectors to sit over existing PLM

Target Market/Persona:

- Targeting large customer size, \$1B+
- Verticle focus: complex discrete manufacturers

Windchill+ Battlecard

- IT profile: DIY PLM. They appear to be moving toward PLM extensions as their business rather than core PLM

Differentiators/Messaging:

- Low risk / upfront cost model for customers
- Service oriented architecture / easy upgrades
- Enterprise open-source business model eliminates PLM license fees and leverages collaboration
- Adaptability / configurability of the platform

Weaknesses

- Poor data scaling and CAD data management
- Upgrade issues from customized / legacy solutions
- Aras rated among lowest in support
- Not true SaaS – It's private cloud for unique do-it-yourself projects. As a result, Aras cannot support customers with continuous updates and improvements the same way Windchill+ does. .NET architecture that is among the least "Cloud ready" among PLM providers

DIY/GSI Hosted

Weaknesses

None of the cloud benefits that come from a full-stack SaaS service including updates and upgrades from PTC.

Customer Proof Points

BALLUFF

Balluff – Balluff is a leading provider of both high-quality sensors as well as system and customer specific industrial automation solutions. Beside the central headquarters near Stuttgart, Balluff has production and development sites as well as 68 international branches and representatives all around the globe.

PTC's Windchill+ SaaS PLM offering was selected for development, testing, quality assurance, staging, and production environments. This enabled the Balluff team – which is replacing every on-prem system with SaaS – to minimize effort while achieving a short ramp up time. [Balluff Case Study Coming Soon.](#)

cellcentric

A Daimler Truck & Volvo Group Company

Cellcentric – Cellcentric is a new joint venture between Daimler and Volvo. The joint venture will develop, produce, and market fuel cell systems ready for series production. Focus is on use in heavy trucks, the systems are also to be offered for other applications. A central goal is to start customer trials of fuel cell trucks in around three years. The company plans to start series production in the second half of the decade. Cellcentric was seeking out a best-in-class cloud PLM to serve as an engineering backbone and digital thread for its greenfield operations. They chose PTC over Siemens and Aras. [Velocity Internal reference.](#)

Windchill+ Battlecard

ZamilAC - Zamil Industrial, a leading business group that develops innovative design and engineering solutions for the construction industry, is now more agile and collaborates more efficiently internally and externally thanks to Windchill+. As a core tool for Zamil's engineers, Windchill+ provides all the benefits of cloud security and the ease of automatic scaling and predictable upgrading of the deployment. [Zamil Windchill+ case study \(English\)](#)

Discovery Questions

Before Scenarios & Negative Consequences

- What are your **top company strategic objectives & priorities**?
 - What are your **biggest challenges** in achieving these objectives?
- What is the **biggest constraint** in your New Product Introduction process? What is the **impact**?
- What date is your PLM renewal?
- What date is your next upgrade?
- Can you walk me through your organizations current process for adopting or upgrading PLM capabilities?
 - In what ways does this current approach impact your business?
- Could you describe for me any situations where you feel your legacy systems or processes inhibit your ability to add new capabilities, tools, or processes?
 - How does this effect your company's ability to stay competitive?
- Can you talk to me about where your current PLM processes come from?
 - For example, home grown/custom, assimilated through acquisition, created through best practices/industry standards.
- When you want to change or implement new processes, how do you go about that?
- What role does your IT organization play when it comes to digital transformation?
- How much of their effort is focused on maintaining operations, vs facilitating the next strategic initiative?
- Which groups outside of Engineering use Windchill (or your current PLM system)?

After Scenarios & Positive Business Outcomes

- What do you believe would be the **biggest benefit** from simplifying access to product development data and deliverables? (Ex: Productivity, Time to Market, Cost of Quality, etc.)
- Which **disciplines** do you feel would benefit most from simplified access to accurate product information?
- How do you think your engineering organization would benefit from always being on the latest release?
- How would your IT strategy change if you no longer had to spend resources to maintain/support your PLM software/infrastructure?
- If you were to de-customize your current processes, how would that effect your digital transformation initiatives?

Objection Handling

- Will I be forced to move from Windchill to Windchill+?
 - No. PTC will continue to develop and support Windchill in tandem with Windchill+.
 - We want customers to move at their own pace. Even if that means not transitioning at all.
- Is Windchill+ a completely new architecture from Windchill? And if so, will I lose the breadth of capabilities of Windchill?
 - No. Windchill+ is built on the same codebase as Windchill and will carry over the same capabilities.
- Will Creo have the same support on Windchill+?
 - Yes.
- Is ThingWorx Navigate supported?
 - Navigate works the same with windchill+ as it does windchill.
- Will I lose or miss-out on any capabilities of Windchill if I choose to adopt Windchill+?
 - No. Windchill+ and Windchill share the same code base. All the out-of-the-box capabilities of Windchill will be available with Windchill+.
 - However, customizations will have to be reviewed and standardized
- Will I be locked-in, and unable to get my data out if I want to transition elsewhere?
 - No. We would assist if you ever needed to go back on premises
- Will Windchill+ be a closed system and inhibit integrations to my other solutions/applications?
 - No. Windchill's open architecture has been a key differentiator among our competition, and we are not sacrificing that with Windchill+.
 - Windchill+ is designed to play well in heterogenous software environments
- Will moving to the cloud/SaaS put my cybersecurity and IP at risk?
 - No. With Windchill+, security is built into every layer of the infrastructure, software, and service environment.
 - Windchill in the cloud has been entrusted to secure some of the most classified IP in the world, including US Navy data.

- With Windchill+ you will always be on the latest release, that means no lingering security updates, bug fixes, etc.
- Will I lose my customizations if I move to Windchill+?
 - Windchill+ will allow for some level of customization/tailoring if they meet some fundamental principles that include security, scalability, and upgradeability
 - Part of the transition process will include an evaluation of your current customizations to identify good and bad customizations and to standardize bad customizations to be extensible and secure. This is not just a required process for SaaS, but critical housekeeping that should be part of any digital transformation initiative.
 - Good customizations:
 - Configuration driven workflows, life cycles, property preferences
 - Coming soon: listener services and the ability to manage new user interfaces through custom tasks
 - Bad customizations
 - Un-supported or deprecated APIs
 - Use of 3rd party libraries in customizations
 - Use of object model and database extensions
 - Back-end access
- How can I justify the price increase of Windchill+ over Windchill?
 - Enterprise SaaS software commonly costs two to three times more than on-premises software
 - While there are cost offsets that potentially justify this from a purely accounting perspective, the cost can be better justified by the accelerating time-to-value and strategic value of SaaS PLM. (Refer to after scenario and positive business outcomes)
- Will it take a long time to convert/transition from Windchill to Windchill+?
 - This really depends based on the amount and complexity of technical debt in your current environment.
 - Part of the transition will be an assessment of customizations and a de-customization process.
 - Based on an initial assessment by our team, projects will be categorized into small, medium, and large.
 - This will require engaging with our tiger team and DXP services to evaluate.
- Will Windchill+ meet my Industry/regulatory requirements?
 - Medical Device and FA&D Clouds are slated to be available as SaaS in FY24/25
- What capabilities will be available when?
 - Point to latest customer facing roadmap
